Triage an issue

Week 7 Friday activity · easy · about 10 minutes an issue

Brian C. Keegan, Ph.D. · Department of Information Science, University of Colorado Boulder

October 2, 2026

What triage is

To triage an issue, you check it against the book as it is today. Then you leave one comment that says what should happen next. You change nothing in the book.

Triage makes the other two activities faster. A pull request needs an issue that is still a problem, and a reviewer needs to know what the issue asks for.

Your chapter's board in week 7's slides lists the issues to triage. A line like `#15 → #59?` asks one question: does pull request #59 fix issue #15?

Work in pairs. One partner works in the browser, and the other reads this handout aloud.

The three Friday activities

Triage an issue	**easy**
Review a pull request	medium
Issue to pull request	hard

Do not

- click **Close issue**;
- change the labels or the assignees;
- fix the problem here. That is *Issue to pull request*.

The instructor merges, closes, and resolves conflicts.

1 · Open the issue

1. Sign in to GitHub.
2. Open the issue. Its address is `https://github.com/cuinfoscience/Web-Data-Science-Book/issues/` followed by its number, for example `.../issues/110`.
3. Read the answers on the form:
   - **Where were you?** gives the chapter;
   - **Which section or heading?** gives the place in the chapter;
   - the long answers say what went wrong, or what is missing.
4. Read the comments under the issue. If someone has already triaged it, go to the next issue on your board.

2 · Check it against the book

1. Open the book: `https://cuinfoscience.github.io/Web-Data-Science-Book/`
2. Go to the chapter that the issue names. Its **Table of contents** (1) jumps to the section (Figure 1).
3. Look for the problem. The book changes every week, so the problem may already be fixed.

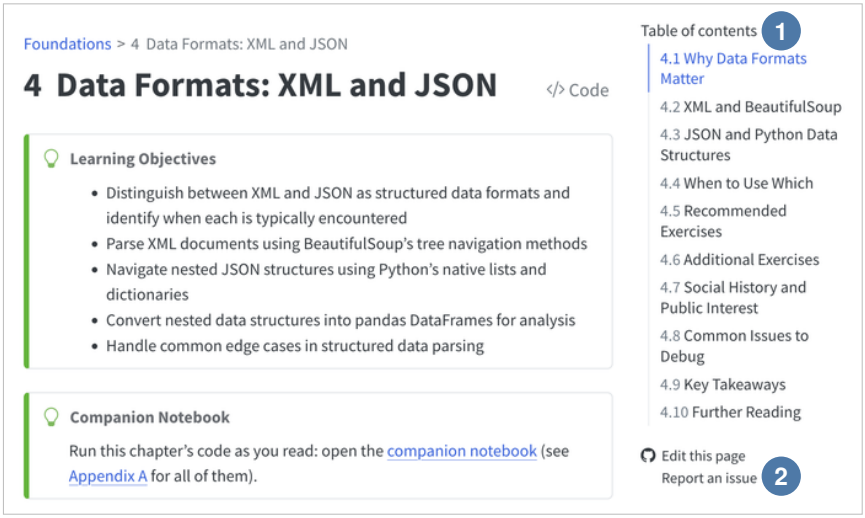

Figure 1. A chapter of the book (here chapter 4). The **Table of contents** 1 jumps to a section. **Report an issue** 2 opens the forms that readers fill in, so every issue names a chapter and a section.

3 · Look for a pull request, and for a twin

1. **A pull request.** On the issue page, look at **Development** in the right-hand sidebar. Then look down the issue's timeline: a pull request that names the issue shows as *mentioned this*, with its number. Open the pull request, and read what it changes.
2. **A twin.** Click the **Issues** tab. Search for a word from the title, such as `traceroute`. Is another open issue about the same problem?

4 · Leave one comment

Find the row that matches what you found. Copy its comment, and change the numbers and the words.

You found	Comment
A pull request fixes it	`#59 fixes this when it merges: it adds the output that this issue asks for.`
A pull request fixes part of it	`#59 adds the output. The second half, a note about rate limits, is still open.`
Another issue reports the same problem	`Duplicate of #13`
The book already fixed it	`Fixed in the book: "Technical Norms: robots.txt" now shows the output (checked October 2).`
It is still a problem, with no pull request	`Still a problem in "Traceroute" (checked October 2). Size: small.`
You can't tell what it asks for	`Suggested title: "Gap: Ch. 5 doesn't say what a hop is". Is that what you meant?`

Use one of three sizes: **small**, a sentence or a link; **medium**, a paragraph or one code cell; **large**, a section, or more than one file.

End the comment with your partner's GitHub name: `Triaged with @partner`. Then click **Comment**.

Next. Triage the next issue on your board. When your chapter's triage is done, review a pull request (`review-a-pull-request.pdf`).
